

Approval Queue Escalation Process

Document Type: Internal training reference | Status: Sanitized starter material

Current queue handling

The approval queue is reviewed during working hours by the operations desk. Most entries are standard approvals, but delayed or blocked items require a visible escalation trail so that supervisors can intervene without duplicate follow-ups.

This procedure is used for operational approvals related to access, refund exceptions, account corrections, and manual override requests.

Escalation levels

Level	When to Use	Action Required
L1 queue follow-up	Item pending more than 4 working hours	Add follow-up note and notify queue owner.
L2 supervisor review	Item pending more than 1 business day or blocker in queue	Classify issue, attach source note, assign supervisor.
Ops lead review	Customer-impacting delay or policy exception	Mark as priority and include risk/context note.
Manual freeze	Duplicate, suspicious, or conflicting approvals	Stop processing and request verification.

Required escalation note format

- Request ID and current queue owner.
- Elapsed time since last meaningful update.
- Reason for escalation in one sentence.
- Source evidence such as approval screenshot, ticket message, or SOP reference.
- Recommended next action.

Do not escalate when

- The item is still within standard response time.
- The requestor has not provided mandatory information.
- The approval owner has already replied with a valid hold reason.
- The issue is a duplicate of an already escalated ticket.

Common review questions

Supervisors usually ask whether the request is complete, whether an exception is being requested, whether the blocker is internal or external, and whether the impact requires same-day handling.
