

Operations Onboarding: Access Request Handling

Document Type: Internal training reference | Status: Sanitized starter material

Purpose and user group

This reference is used by operations coordinators when a new associate requires access to internal workflow tools. The document explains the first-pass checks before an access request is routed to the platform owner.

The process is intentionally conservative. Coordinators should not approve access directly unless the required role, manager approval, and business purpose are visible in the request.

Required information before routing

- Associate name, official email address, and team mapping.
- Requested role type such as Viewer, Processor, Reviewer, or Team Lead.
- Manager approval note or ticket reference.
- Business purpose and expected access duration.
- Any exception reason if the requested role is higher than the default team role.

Standard routing rules

Requests with complete details and a standard role can be routed to the platform owner queue. Requests with missing manager approval should be returned to the requestor with a clarification note.

Requests for Reviewer or Team Lead access must be marked for supervisor review even when manager approval is present.

Request Type	Route To	Operational Note
Viewer / Processor	Platform owner queue	Allowed when manager approval and team mapping are present.
Reviewer	Supervisor review queue	Requires explicit business justification.
Team Lead	Ops lead review	Use only for named leads or temporary coverage.
Temporary access	Platform owner + expiry note	Expiry date must be stored in the request notes.

Escalation cues

- Requested role does not match team mapping.
- Approval message is informal or does not identify the approving manager.
- Request mentions urgent production work but does not provide ticket reference.
- Multiple access requests are submitted for the same user within one week.

Expected output from coordinator

The coordinator should leave a short routing note that states whether the request is complete, what role is being requested, and whether manual review is required. The note should be clear enough for the next queue owner to act without reopening the full request thread.
